Umbilical catheters
Single-lumen umbilical catheters

Umbilical venous catheters are used for:
- Parenteral nutrition & fluid administration
- Drugs administration
- Venous blood sampling
- Transfusion of blood or blood products
- Exchange transfusion

Umbilical arterial catheters are used for:
- Arterial blood sampling
- Arterial pressure measurement
- Blood pH and blood gas analysis
- Fluids and drugs administration

Double-lumen umbilical catheters

Color-coded hubs
- Easy identification and safety

Neonatal clamps
- Rounded and light

PUR catheter
- Good haemocompatibility
- Reduced risk of thrombosis

Luer-lock connector
- Efficient connection

Radiopaque catheter
- Control of catheter positioning under X-ray

Numerical marking every cm
- Easy check of the length of catheter inserted

Blunt distal tip
- Atraumatic insertion
- Preservation of the vein
**Triple-lumen umbilical catheter**

- Extremely premature baby born around 24 weeks (to avoid multiple access and maintain continuous administration)
- Small-for-Gestational-Age (SGA) infant
- Term infant suffering from Persistent pulmonary hypertension (PPHN)
- Newborn suffering from Hypoplastic Left Heart Syndrome (HLHS)

**Insertion technique**

1. Use strict aseptic technique, disinfect the abdominal wall and cord stump. Place a sterile drape with central opening.
2. Loosely tie an umbilical tape around the cord stump to control bleeding. Cut the umbilical cord horizontally 1 cm above the skin, remove any clots which may obstruct the vessel lumen.
3. Identify the vessels: arteries are small, thick walled spiralling vessels and vein is larger and thin walled.
4. Prime the catheter and if required dilate the vessel using iris forceps.
5. Advance the catheter using short, smooth strokes.
6. Use the cm markings on the catheter to note the length of catheter inserted.
7. Place a suture in the wall of the cord taking care not to puncture the catheter.
8. Dress the catheter according to your local policies.

**Positioning:**

Always check the location of the catheter by radiography.

- **For arterial catheterization:** Umbilical arterial catheter can be sited either in the high position or the low position though the higher position is associated with lower complication rates \(^{(1,2,3)}\). Use of high positioning of umbilical arterial catheter is recommended \(^{(4)}\).
- **For venous catheterization,** the catheter tip should be placed beyond the ductus venosus in the central venous system (inferior vena cava). In emergency situations, the catheter can be inserted 2-3 cm (until blood is returned) and emergency meds can be given. The catheter should not be left in this location and should be removed after giving emergency medications.
Umbilical Placement Set

The umbilical placement set is a procedure pack containing all the necessary material to place an umbilical catheter.

- **Save time and money** by reducing preparation time / Improving stock management/ Reducing waste
- **Increase safety** by reducing the risk of infection / Simplifying procedure / Traceability
- **Instruments dedicated to neonates**: Neonatal tourniquet designed to reduce skin trauma / Non adhesive drapes respectful of the fragile skin of newborns.
